# Analysis and Visualization

Philipp Koehn

10 November 2020

# analytical evaluation

# Error Analysis

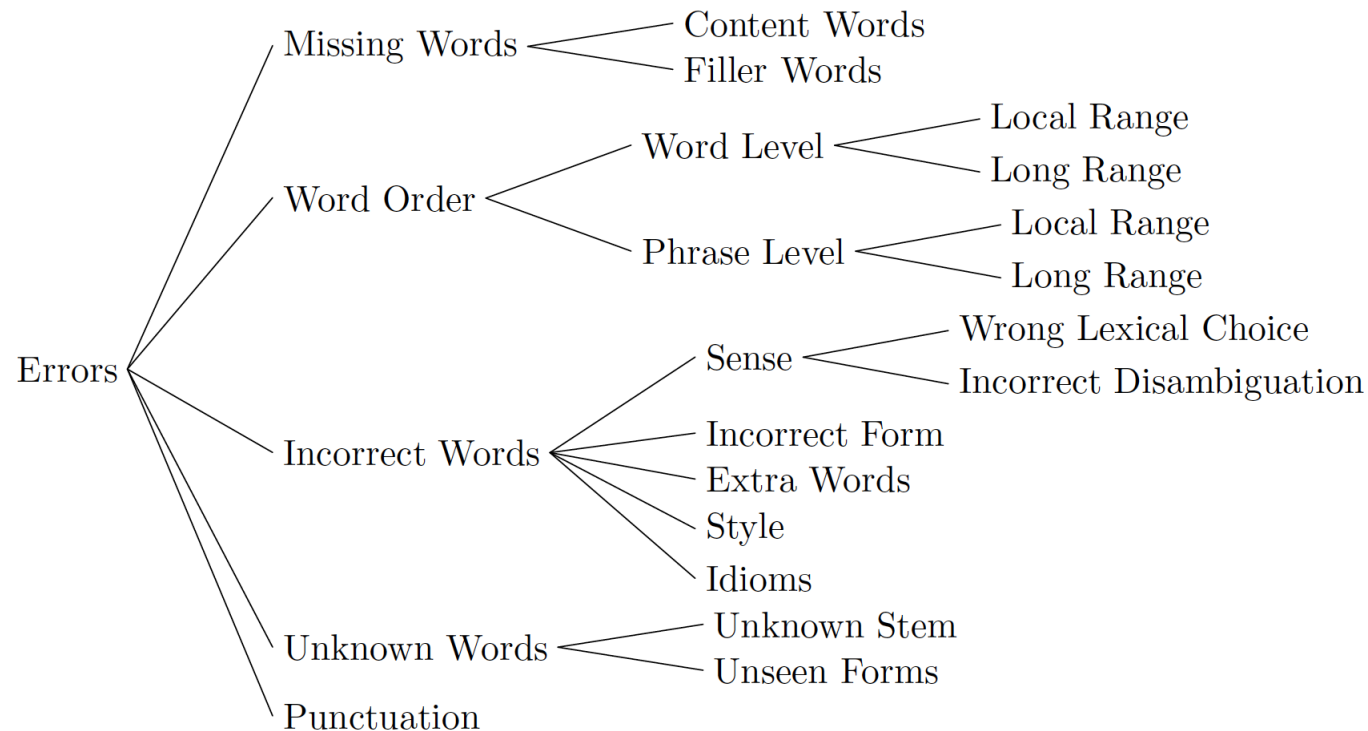

- Manually inspect output of machine translation system
- Identify errors and categorize them
- Specific problems of neural machine translation
  - dropped input / added output
  - gibberish (*the the the the*)
  - hallucinated output

# Hallucinated Output

- Examples of extreme translation failures
  - Low resource example  
*Republican strategy to counter the re-election of Obama*  
*Un órgano de coordinación para el anuncio de libre determinación*
  - Out of domain example  
*Schaue um dich herum.*  
*EMEA / MB / 049 / 01-EN-Final Work programme for 2002*
- Neural MT goes off track
  - turns into generative language model
  - ignores input context

# Linguistic Categories

“Error Analysis of Statistical Machine Translation Output” (Vilar et al., LREC 2006)

# MQM

- Manually corrected machine translation
- Breakdown of word edits
  - by part-of-speech tag
  - multi-word construction, e.g.,  
AUX:V constructions such as *can eat*
- Systems
  - NMT: neural machine translation
  - PBSY: phrase-based statistical
  - HPB: hierarchical phrase-based statistical
  - SPB: syntax-based statistical

# targeted test sets

# Challenge Set

- Create challenging sentence pairs with specific problems

Src	The repeated calls from his mother <b>should</b> have alerted us.
Ref	Les appels répétés de sa mère <b>auraient</b> dû nous alerter.
Sys	Les appels répétés de sa mère devraient nous avoir alertés.
Is the subject-verb agreement correct (y/n)? <b>Yes</b>	

- “A Challenge Set Approach to Evaluating Machine Translation”  
(Isabelle et al., EMNLP 2017)

# Challenge Set: Results

Category	Subcategory	#	PBMT-1	NMT	Google NMT

# Contrastive Translation Pairs

- Goal: find out how well certain translation problems are handled
- Examples
  - noun phrase agreement
  - subject-verb agreement
  - separable verb particle
  - polarity (negative/positive)
- Idea: forced decoding with contrastive translation pair
  - positive example: correct translation
  - negative example: translation with error
- Check if positive example gets better score

# Contrastive Translation Pairs

- Noun phrase agreement
  - **good:** ... *these interesting proposals* ...
  - **bad:** ... *this interesting proposals* ...
- Subject-verb agreement
  - **good:** ... *the idea to extend voting rights was* ...
  - **bad:** ... *the idea to extend voting rights were* ...
- Separable verb prefix
  - **good:** ... *switch the light on* ...
  - **bad:** ... *switch the light by* ...

- Compares neural machine translation systems for English–German
- Varying word encoding
  - byte pair encoding (BPE)
  - character-based word embeddings (char)
- Results

system	agreement		verb particle	polarity (negation)	
	noun phrase	subject-verb		insertion	deletion
BPE-to-BPE	95.6	93.4	91.1	97.9	91.5
BPE-to-char	93.9	91.2	88.0	98.5	88.4
char-to-char	93.9	91.5	86.7	98.5	89.3
human	99.4	99.8	99.8	99.9	98.5

- Create artificial training examples to assess capability of systems
- Example: bracketing language
  - $(\{\})$
  - $(\{\}\{()\})$
  - $\{(\{\}\{()\})\{()\}$
- Check ability to make correct predictions based on nesting depth, length, etc.

Jahren										98	
angespannt								84			
.						11	14	23			49

# Multi-Head Attention

16

# Multi-Head Attention

17

*“Many of the attention heads exhibit behaviour that seems related to the structure of the sentence.”*

# Word Embeddings

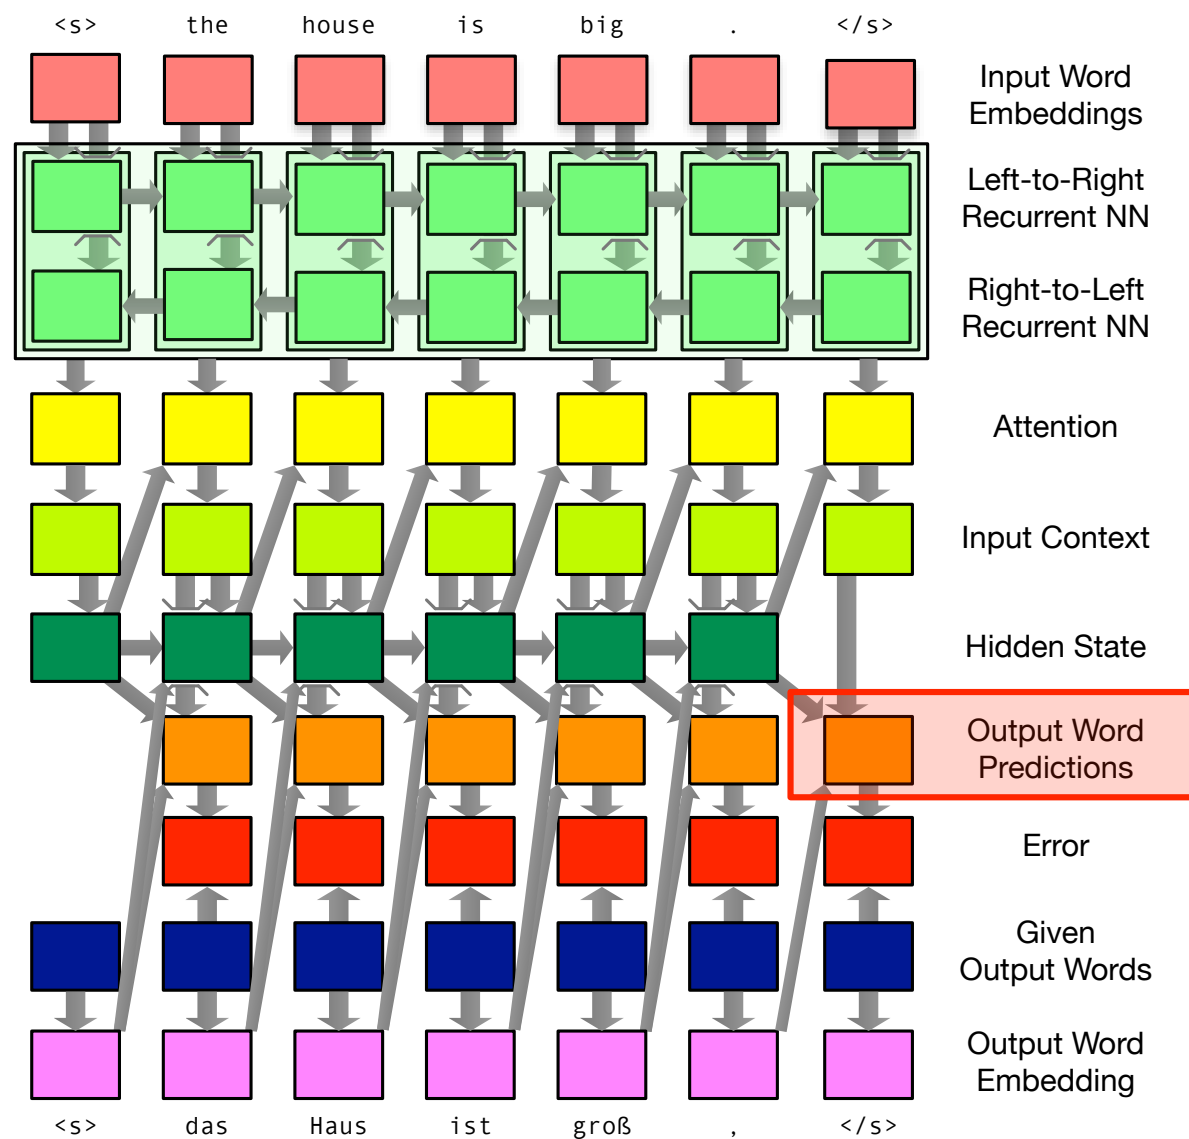

18

# Word Sense Clusters

# Input Context and Decoder State

# Input Context vs. Decoder State

- Input: *Republican strategy to counter the re @-@ election of Obama*

- KL divergence between decoder predictions with and w/o input context
- Input context matters more for content words

# visualization tools

- Tools for inspecting behavior of models and algorithms
- Helps to get insights
- Examples
  - “Interactive Visualization and Manipulation of Attention-based Neural Machine Translation” (Lee et al., EMNLP 2017)
  - “SEQ2SEQ-VIS : A Visual Debugging Tool for Sequence-to-Sequence Models” (Strobelt et al., 2018)

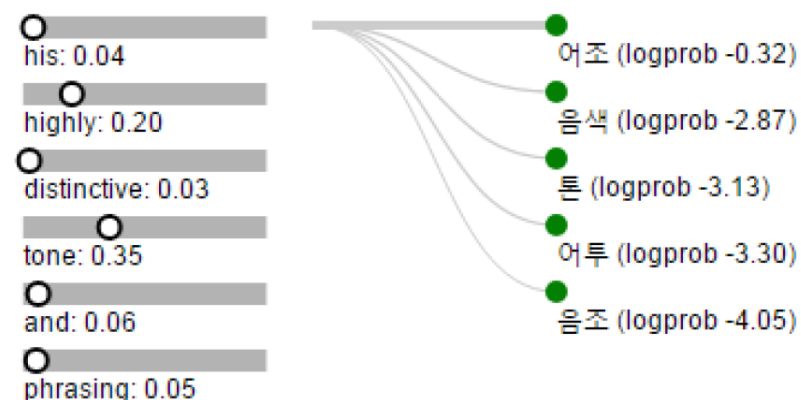

# Search Graph

24

# Manipulating Search

- Inspect attention weights
- Change attention weights → check change in word prediction

# Predictions

- E/D: encoder and decoder words
- S3: attention weights
- S4: top  $k$  predictions

# Trajectory of Decoder States

# Decoder State Neighborhoods

- 2-D projections of decoder states
- Database of decoder states in training data
- Show neighborhood

# Similar Decoder State

S2

☆ 🗑	<s> this means we all benefit when another country gets <b>rich</b> . </s>
☆ 🗑	<s> the prayer book is dark in both images and it comes out <b>dark</b> . </s>
☆ 🗑	<s> now black holes are <b>dark</b> against a dark sky . </s>
☆ 🗑	<s> furthermore , the roof of the car is causing what we call a shadow cloud inside the car which is making it <b>darker</b> . </s>
☆ 🗑	<s> the prayer book is <b>dark</b> in both images and it comes out dark . </s>
☆ 🗑	<s> i live cycles of light and <b>darkness</b> . </s>
☆ 🗑	<s> this is mcmurdo itself . about a thousand people work here in summer , and about 200 in winter when it &apos;s completely <b>dark</b> for six months . </s>
☆ 🗑	<s> this is a tumor : <b>dark</b> , gray , ominous mass growing inside a brain . </s>
☆ 🗑	<s> but even though the black hole is <b>dark</b> from the outside , it &apos;s not dark on the inside , because all of the light from the galaxy can fall in behind us . </s>
☆ 🗑	<s> <unk> adapted with layers of fat . sea lions got <b>sleek</b> . </s>
☆ 🗑	<s> the archimedes text is <b>dark</b> in one image and bright in another . </s>
☆ 🗑	<s> then things get <b>tense</b> . </s>
☆ 🗑	<s> under those conditions , the foxo protein in blue has gone into the <b>nucleus</b> -- that little compartment there in the middle of the cell -- and it &apos;s sitting down on a gene binding to it . </s>

# probing representations

# What is in a Representation?

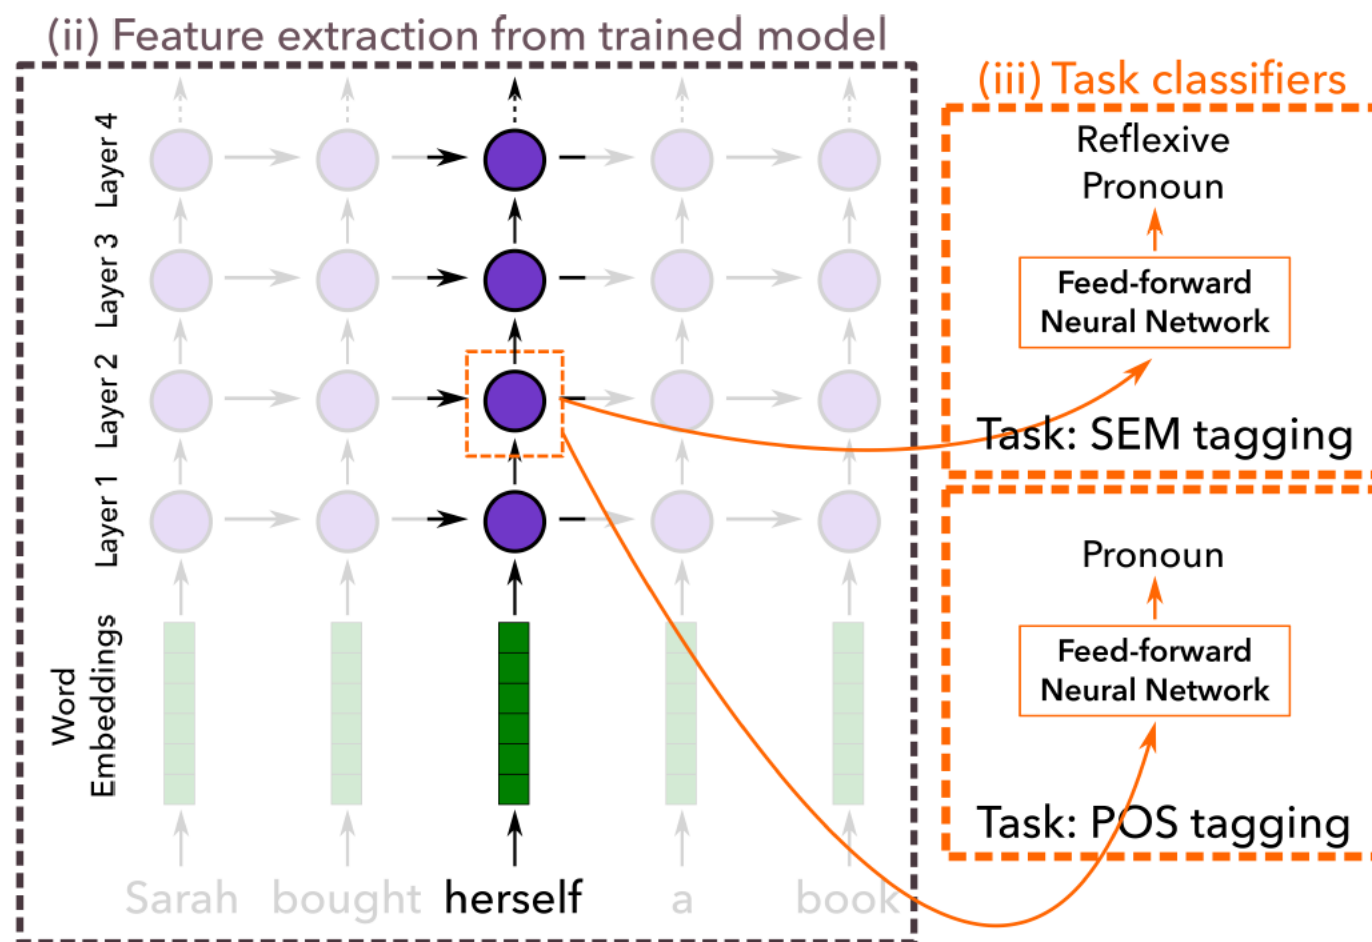

- What is contained in an intermediate representation?
  - word embedding
  - encoder state
  - decoder state
- More specific questions
  - does the model discover morphological properties?
  - does the model disambiguate words?

- Pose a hypothesis, e.g.,

*Encoder states discover part-of-speech.*

- Formalize this as a classification problem
  - given: encoder state for word *dog*
  - label: singular noun (NN)
- Train on representations generated by running inference
  - translate sentences not seen during training
  - record their encoder states
  - look up their part of speech tags (running POS tagger or use labeled data)
  - training example (encoder state ; label)
- Test on new sentences

“Evaluating Layers of Representation in Neural Machine Translation on Part-of-Speech and Semantic Tagging Tasks” (Belinkov et al., ACL 2017)

- LSTM sequence-to-sequence model without attention
- Different tasks
  - translate English into Russian, German
  - copy English
  - copy permuted English
  - parse English into linearized parse structure
- Predict
  - constituent phrase (NP, VP, etc.)
  - passive voice and tense
- Findings
  - much better quality when translating than majority class
  - same quality for copying as majority class

- Attentional neural machine translation model
- Predict
  - part-of-speech tag
  - semantic tag
    - \* type of named entity
    - \* semantic relationships
    - \* discourse relationships
- Findings
  - compare prediction quality of different encoder layers
  - mostly better performance at deeper layers
  - little impact from target language

- Attentional neural machine translation model with character-based word embeddings
- Predict for morphologically rich input languages
  - part-of-speech tag
  - morphological properties
- Findings
  - character-based representations much better for learning morphology
  - word-based models are sufficient for learning structure of common words
  - lower layers better at word structure, deeper layers better at word meaning
  - target language matters for what information is learned
  - neural decoder learns very little about word structure

# relevance propagation

# What Determined Output Decision?

- What part of the network had the biggest impact on final decision?
- For instance machine translation:
  - prediction of a specific output word
  - which of the input words mattered most?
  - which of the previous output words mattered most?

# Layer-Wise Relevance Propagation

- Start with output prediction  
i.e., high value for word in softmax
- Compute backwards what contributed to this high value
- First step
  - consider values of previous layer
  - consider weights from previous layer
  - assign relevance values for each node in previous layer
  - normalize so they add up to one
- Recurse until input layer is reached

# Example: Chinese–English

“Visualizing and Understanding Neural Machine Translation”  
(Ding, Liu, Luang and Sun, ACL 2017)

- Important question for users

*Why did the network reach this decision?*

- Tracing back decisions to inputs

⇒ Causal explanation

# identifying neurons

# Visualizing Individual Cells

Cell sensitive to position in line:

The sole importance of the crossing of the Berezina lies in the fact that it plainly and indubitably proved the fallacy of all the plans for cutting off the enemy's retreat and the soundness of the only possible line of action--the one Kutuzov and the general mass of the army demanded--namely, simply to follow the enemy up. The French crowd fled at a continually increasing speed and all its energy was directed to reaching its goal. It fled like a wounded animal and it was impossible to block its path. This was shown not so much by the arrangements it made for crossing as by what took place at the bridges. When the bridges broke down, unarmed soldiers, people from Moscow and women with children who were with the French transport, all--carried on by vis inertiae--pressed forward into boats and into the ice-covered water and did not, surrender.

Cell that turns on inside quotes:

"You mean to imply that I have nothing to eat out of.... On the contrary, I can supply you with everything even if you want to give dinner parties," warmly replied Chichagov, who tried by every word he spoke to prove his own rectitude and therefore imagined Kutuzov to be animated by the same desire.

Kutuzov, shrugging his shoulders, replied with his subtle penetrating smile: "I meant merely to say what I said."

Karpathy et al. (2015): "Visualizing and Understanding Recurrent Networks"

# Visualizing Individual Cells

Cell that robustly activates inside if statements:

```
static int __dequeue_signal(struct sigpending *pending, sigset_t *mask,
                           siginfo_t *info)
{
    int sig = next_signal(pending, mask);
    if (sig) {
        if (current->notifier) {
            if (sigismember(current->notifier_mask, sig)) {
                if (!current->notifier(current->notifier_data)) {
                    clear_thread_flag(TIF_SIGPENDING);
                    return 0;
                }
            }
        }
        collect_signal(sig, pending, info);
    }
    return sig;
}
```

A large portion of cells are not easily interpretable. Here is a typical example:

```
/* Unpack a filter field's string representation from user-space
 * buffer. */
char *audit_unpack_string(void **bufp, size_t *remain, size_t len)
{
    char *str;
    if (!*bufp || (len == 0) || (len > *remain))
        return ERR_PTR(-EINVAL);
    /* Of the currently implemented string fields, PATH_MAX
     * defines the longest valid length.
     */
}
```

# Identifying Neurons

- How are specific properties encoded?
- Easiest case: in a single neuron
- How do we find it? ■
- Example: length of sequence
  - given: encoder-decoder model without attention
  - does the encoder record the length of the consumed sequence?
  - does the decoder record the length of the generated sequence?

- Select a neuron
- Compute correlation
  - value of neuron when processing  $x$ th word
  - position  $x$
- Success if highly correlated neuron found

# Neurons Correlated with Length

“Why neural translations are the right length” (Shi, Knight, Yuret, EMNLP 2016)

questions?
