

---

# Corpus Acquisition from the Internet

Philipp Koehn

partially based on slides from Christian Buck

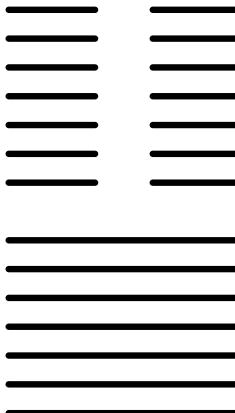

13 November 2018

# Big Data

For many language pairs, lots of text available.

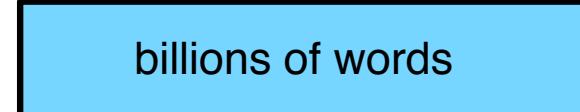

**Text you read  
in your lifetime**

300 million words

**Translated text  
available**

billions of words

**English text  
available**

trillions of words

# Mining the Web

- Largest source for text: the World Wide Web

Common Crawl

- publicly available crawl of the web
- hosted by Amazon Web Services, but can be downloaded
- regularly updated (semi-annual)
- 2-4 billion web pages per crawl
- Currently filling up hard drives in our lab

# Monolingual Data

- Starting point: 35TB of text
- Processing pipeline [Buck et al., 2014]
  - language detection
  - deduplication
  - normalization of Unicode characters
  - sentence splitting
- Obtained corpora

Language	Lines (B)	Tokens (B)	Bytes	BLEU (WMT)
English	59.13	975.63	5.14 TB	-
German	3.87	51.93	317.46 GB	+0.5
Spanish	3.50	62.21	337.16 GB	-
French	3.04	49.31	273.96 GB	+0.6
Russian	1.79	21.41	220.62 GB	+1.2
Czech	0.47	5.79	34.67 GB	+0.6

# Parallel Data

- Basic processing pipeline [Smith et al., 2013]
  - find parallel web pages (based on URL only)
  - align document by HTML structure
  - sentence splitting and tokenization
  - sentence alignment
  - filtering (remove boilerplate) ■
- Obtained corpora

	French	German	Spanish	Russian	Japanese	Chinese
Segments	10.2M	7.50M	5.67M	3.58M	1.70M	1.42M
Foreign Tokens	128M	79.9M	71.5M	34.7M	9.91M	8.14M
English Tokens	118M	87.5M	67.6M	36.7M	19.1M	14.8M
	Bengali	Farsi	Telugu	Somali	Kannada	Pashto
Segments	59.9K	44.2K	50.6K	52.6K	34.5K	28.0K
Foreign Tokens	573K	477K	336K	318K	305K	208K
English Tokens	537K	459K	358K	325K	297K	218K

- Much more work needed!

# Data Cleaning and Subsampling

- Not all data useful – some may be harmful
- Removing data based on
  - domain relevance
  - alignment quality
  - redundancy
  - bad language (orthography, non-words)
  - machine translated or poorly translated
- Removing bad data always reduces training time
- Removing bad data sometimes helps quality
- Clean data approach (only using high quality data) helps in limited domains

# corpus crawling

# Finding Monolingual Text

- Simple Idea
  1. Download many websites
  2. Extract text from HTML
  3. Guess language of text
  4. Add to corpus
  5. Profit
- Turns out all these steps are quite involved

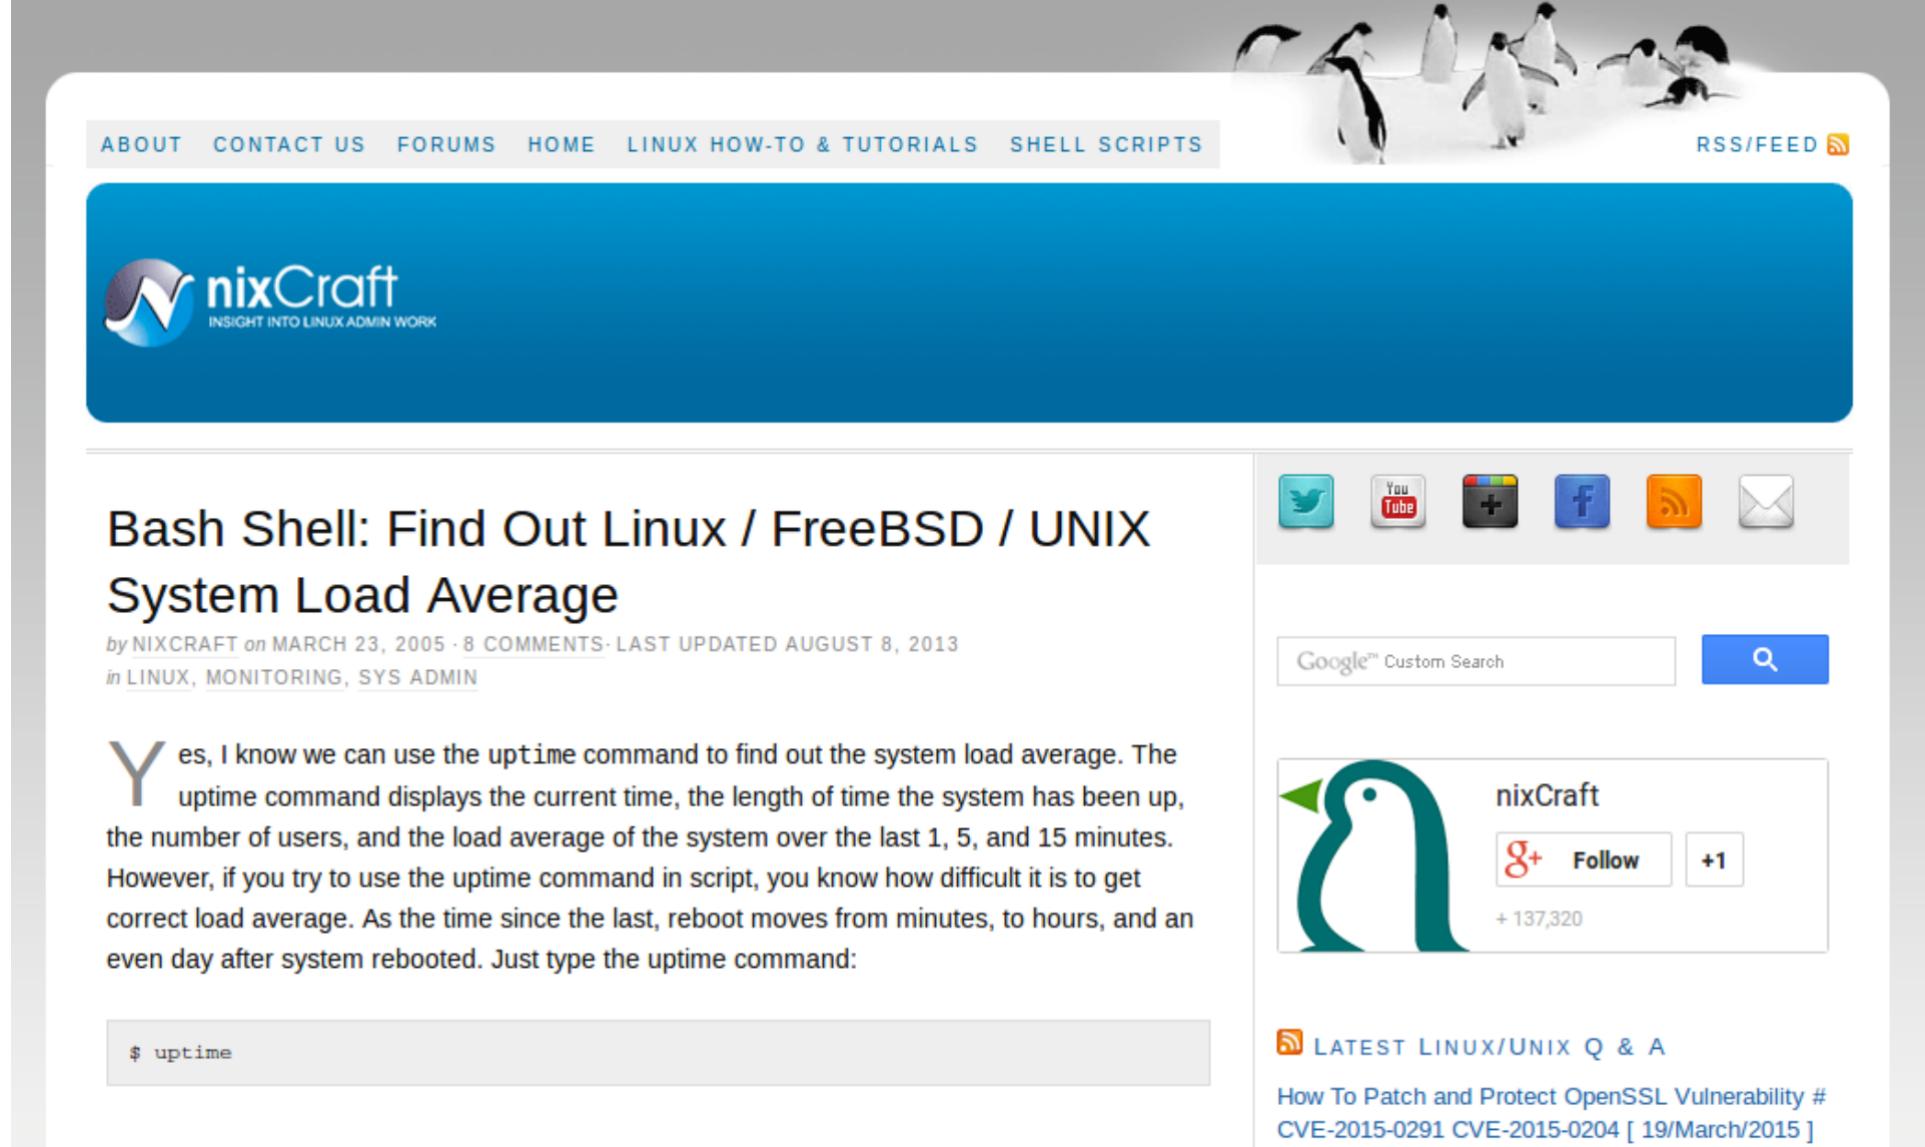

# Common Crawl

- Non-profit organization
- Data
  - publicly available on Amazon S3
  - e.g. January 2015: 140TB / 1.8B pages
- Crawler
  - Apache Nutch
  - collecting pre-defined list of URLs

# extracting text

# A Web Page

The screenshot shows a web page from the website [nixCraft](#). At the top, there is a navigation bar with links for About, Contact Us, Forums, Home, Linux How-to & Tutorials, and Shell Scripts. To the right of the navigation bar is a decorative banner featuring several penguins. Below the banner, the [nixCraft](#) logo is displayed, followed by the tagline "INSIGHT INTO LINUX ADMIN WORK". The main content area features a large blue header with the title "Bash Shell: Find Out Linux / FreeBSD / UNIX System Load Average". Below the title, the author information "by NIXCRAFT on MARCH 23, 2005 · 8 COMMENTS · LAST UPDATED AUGUST 8, 2013" and categories "in LINUX, MONITORING, SYS ADMIN" are shown. The main article text discusses the `uptime` command and its limitations when used in scripts. A code block at the bottom shows the command `\$ uptime`. To the right of the main content, there is a sidebar with social sharing icons for Twitter, YouTube, Google+, Facebook, RSS, and Email. Below these are search and search results sections, including a Google Custom Search bar and a box for the [nixCraft](#) Google+ page. The sidebar also includes a link to "LATEST LINUX/UNIX Q & A" and a news item about OpenSSL vulnerabilities.

**Bash Shell: Find Out Linux / FreeBSD / UNIX System Load Average**

by NIXCRAFT on MARCH 23, 2005 · 8 COMMENTS · LAST UPDATED AUGUST 8, 2013  
in LINUX, MONITORING, SYS ADMIN

**Y**es, I know we can use the `uptime` command to find out the system load average. The `uptime` command displays the current time, the length of time the system has been up, the number of users, and the load average of the system over the last 1, 5, and 15 minutes. However, if you try to use the `uptime` command in script, you know how difficult it is to get correct load average. As the time since the last reboot moves from minutes, to hours, and an even day after system rebooted. Just type the `uptime` command:

```
$ uptime
```

Y

es, I know we can use the `uptime` command to find out the system load average. The `uptime` command displays the current time, the length of time the system has been up, the number of users, and the load average of the system over the last 1, 5, and 15 minutes. However, if you try to use the `uptime` command in script, you know how difficult it is to get correct load average. As the time since the last reboot moves from minutes, to hours, and an even day after system rebooted. Just type the `uptime` command:

```
$ uptime
```

Sample outputs: 1:09:01 up 29 min, 1 user, load average: 0.00, 0.00, 0.00

# language detection

# What Language?

Muitas intervenções alertaram para o facto de a política dos sucessivos governos PS, PSD e CDS, com cortes no financiamento das instituições do Ensino Superior e com a progressiva desresponsabilização do Estado das suas funções, ter conduzido a uma realidade de destruição da qualidade do Ensino Superior público.

## Clues: Letter N-Grams

Muitas intervenções alertaram para o facto de a política dos sucessivos governos PS, PSD e CDS, com cortes no financiamento das instituições do Ensino Superior e com a progressiva desresponsabilização do Estado das suas funções, ter conduzido a uma realidade de destruição da qualidade do Ensino Superior público.

# Example: langid.py

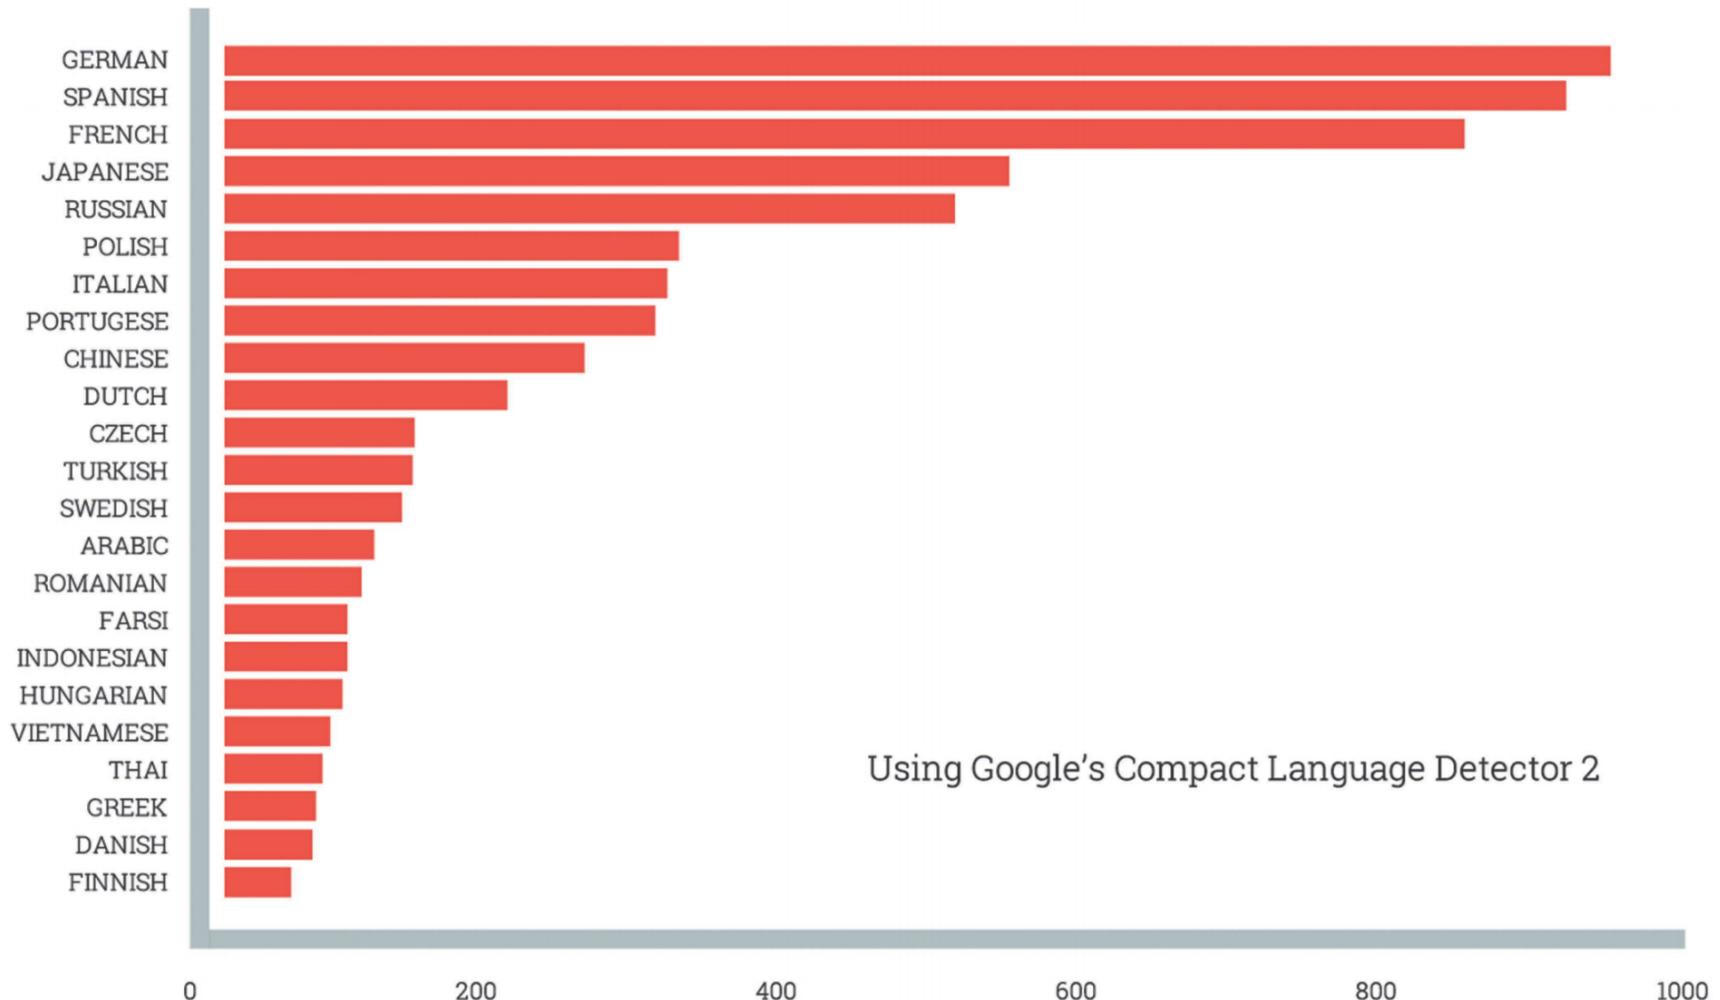

- Muitas intervenções alertaram
  - prediction: Portuguese
  - high confidence (-90.8)
- Muitas intervenções
  - prediction: Portuguese
  - fairly high confidence (-68.2)
- Muitas
  - prediction: English
  - low confidence (9.1)

# Language Identification Tools

- langid.py (Lui & Baldwin, ACL 2012)
  - 1-4 grams, NaiveBayes, Feature Selection
- TextCat (based on Cavnar & Trenkle, 1994)
  - similar to langid.py
  - no Feature Selection
- Compact/Chromium Language Detector 2 (Google)
  - takes hints from tld, meta data
  - super fast
  - detects spans of text

# Detected Languages in CommonCrawl

(Buck and Heafield, LREC2014)

# Most Common English Phrases

# bilingual corpus crawling

# Mining Bilingual Text

- Bilingual text = same text in different languages
- Usually: one side translation of the other
- Full page or interface/content only
- Potentially translation on same page
  - e.g., Twitter, Facebook posts

# Pipeline

1. Identify web sites worth crawling
2. Crawl web site
3. Language detection — as before
4. Extract text from HTML — as before
5. Align documents
6. Align sentences
7. Clean corpus

# identify web sites

# Targeted Crawling

- A few web sites with a lot of parallel text, e.g.,
  - European Union, e.g., proceedings of the European Parliament
  - Canadian Hansards
  - United Nations
  - Project Syndicate
  - TED Talks
  - Movie / TV show subtitles
  - Global Voices
- Hand-written tools
  - crawling
  - text extraction
  - document alignment
- Few days effort per site

... the open parallel corpus

OPUS is a growing collection of translated texts from the web. In the OPUS project we try to convert and align free or to provide the community with a publicly available parallel corpus. OPUS is based on open source products and the cc package. We used several tools to compile the current collection. All pre-processing is done automatically. No manual

The OPUS collection is growing! Check this page from time to time to see new data arriving ...  
Contributions are very welcome! Please contact <jorg.tiedemann@lingfil.uu.se>

Search & download resources:

## Search & Browse

- OPUS multilingual search interface
- Europarl v7 search interface
- Europarl v3 search interface
- OpenSubtitles search interface
- EUconst search interface
- Word Alignment Database

## Tools & Info

- OPUS Wiki
- Tools for tagging and parsing
- Downloads (tools and models)

## Sub-corpora (downloa

- Books - A collect
- DGT - A collecti
- DOGC - Docume
- ECB - European t
- EMEA - Europea
- The EU booksho
- EUconst - The Et
- EUOPARL v7 -
- EUOPARL - Et
- GNOME - GNOM
- The Croatian - Er
- JRC-Acquis- legi

# Broad Crawling

- Identify many web sites to crawl
  - has the phrase **This page in English** or variants
  - has link to language flag
  - known to have content in multiple languages (from CommonCrawl)
- Follow links
  - up to  $n$  links deep into site
  - up to  $n$  links in total
  - only follow links to web pages, not images, etc.
- Avoid crawling sites too deeply that do not have parallel text?  
(requires quick feedback from downstream processing)

# document alignment

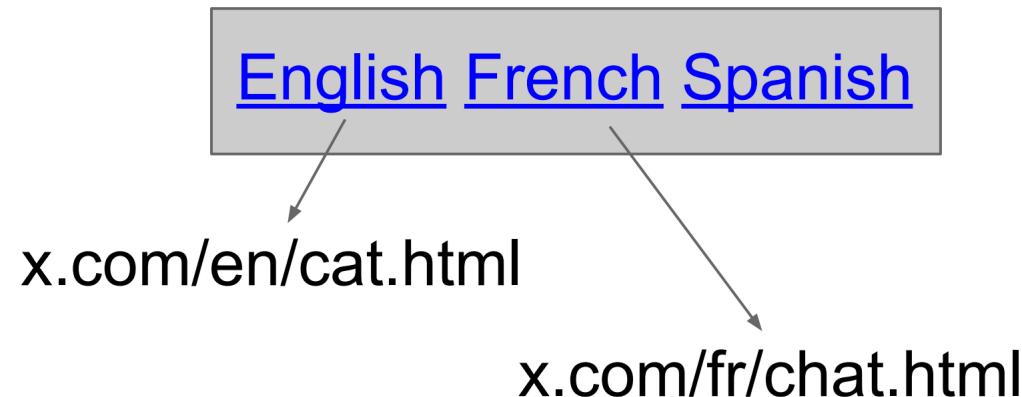

# Document Alignment

- Early Work: STRAND (Resnik 1998, 1999)  
(Structural Translation Recognition, Acquiring Natural Data)
- Pipeline
  1. candidate generation
  2. candidate ranking
  3. filtering
  4. optional: sentence alignment
  5. evaluation

# Link Structure

- Parent page: a page that links to different language versions

# Parent Page Example

The screenshot shows a web browser window titled "Apple - Support". The address bar displays "Apple Inc. [US] https://support.apple.com/HT201361/localeselec...". Below the address bar, there are icons for a mobile phone, a lock, a star, and other navigation controls.

The main content area displays a grid of nine country flags and their names:

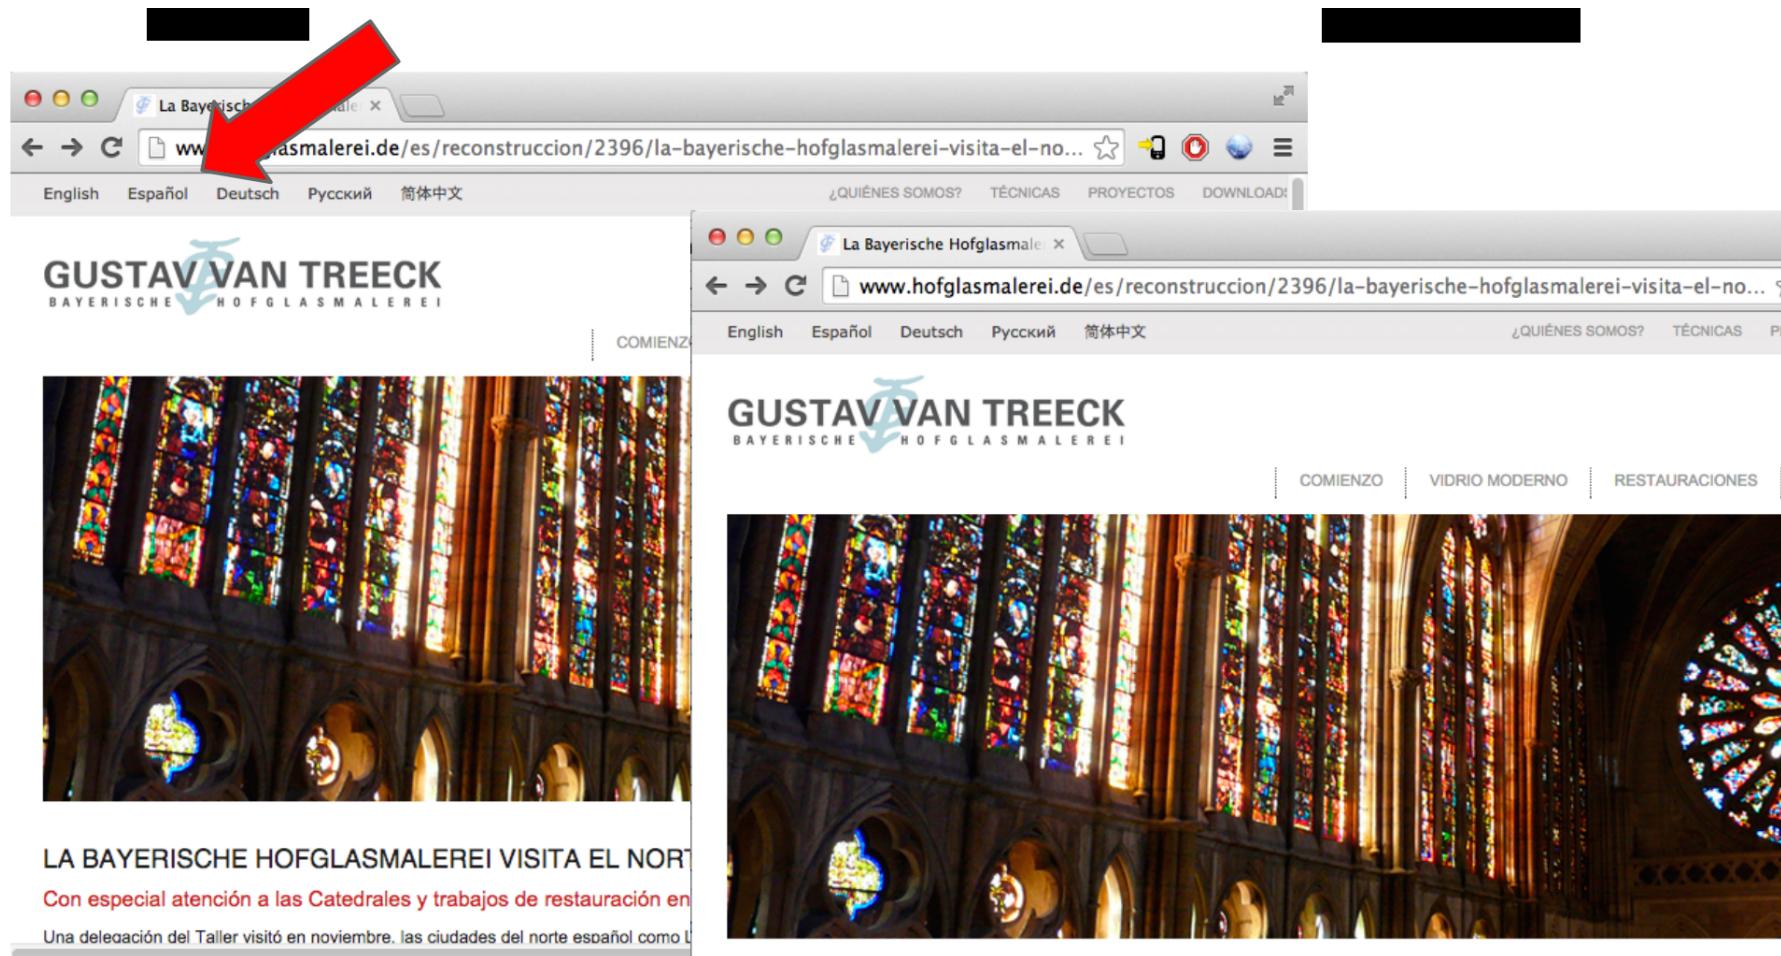

Albania	Cyprus	Česká republika
Iceland	Ireland	Macedonia
Magyarország	Malta	Moldova
Montenegro	Polska	Portugal

At the bottom of the page, a link is visible: <https://support.apple.com/pl-pl/HT201361>.

# Sibling Page

- A page that links to its translation in another language

# URL Matching

- Often URLs differ only slightly, often indicating language

xyz.com/en/	xyz.com/fr/
xyz.com/bla.htm	xyz.com/bla.htm?lang=FR
xyz.com/the_cat	xyz.fr/le_chat

# Finding URL Patterns

- URLs with pattern =en

Count	Pattern
545875	lang=en
140420	lng=en
126434	LANG=en
110639	hl=en
99065	language=en
81471	tlng=en
56968	l=en
47504	locale=en
33656	langue=en
33503	lang=eng
19421	uil=English
15170	ln=en
14242	Language=EN
13948	lang=EN
12108	language=english
11997	lang=engcro
11646	store=en

# Finding URL Patterns

- URLs with pattern lang.\*=.\*

Count	Pattern
13948	lang=EN
13456	language=ca
13098	switchlang=1
12960	language=zh
12890	lang=Spanish
12471	lang=th
12266	langBox=US
12108	language=english
12003	lang=cz
11997	lang=engcro
11635	lang=sl
11578	lang=d
11474	lang=lv
11376	lang=NL
11349	lang=croeng
11244	lang=English

# Document Length

- Extract texts and compare lengths (Smith 2001)

$$\text{Length}(E) \approx C * \text{Length}(F)$$

learned,  
language-specific parameter

- Document or sentence level

# Document Object Model

37

- Translated web pages often retain similar structure

```
<html>
  <body>
    <h1>
      Where is the cat?
    </h1>
    The cat sat on
    the mat.
  </body>
</html>
```

```
<html>
  <body>
    El gato se sentó
    en la alfombra.
  </body>
</html>
```

- This includes links to the same images, etc.

# Linearized Structure

[Start:html]	[Start:html]
[Start:body]	[Start:body]
[Start:h1]	[Chunk:32bytes]
[Chunk:17bytes]	[End:body]
[End:h1]	[End:html]
[Chunk:23bytes]	
[End:body]	
[End:html]	

# Levenshtein Alignment

[Start:html]	Keep
[Start:body]	Keep
[Start:h1]	Delete
[Chunk:17bytes]	Delete
[End:h1]	Delete
[Chunk:23bytes]	23 Bytes -> 32 Bytes
[End:body]	Keep
[End:html]	Keep

# Content Similarity

- Simple things
  - same numbers or names in documents
  - often quite effective
- Use of lexicon
  - treat documents as bag of words
  - consider how many words in EN document have translations in FR document
- A bit more complex
  - semantic representations of documents content
  - bag of word vectors
  - neural network embeddings
- Major challenge: do this fast for  $n \times m$  document pairs

# Google's Content Matching

- Basic idea: translate everything into English, match large n-grams
- For each non-English document:
  1. Translate everything to English using MT
  2. Find distinctive ngrams
    - (a) rare, but not too rare (5-grams)
    - (b) used for matching only
- Build inverted index: ngram → documents

[cat sat on] → {[doc<sub>1</sub>, ES], [doc<sub>3</sub>, DE], ...}  
[on the mat] → {[doc<sub>1</sub>, ES], [doc<sub>2</sub>, FR], ...}

# Matching using Inverted Index

[cat sat on] -> {[doc<sub>1</sub>, ES], [doc<sub>3</sub>, DE], ...}  
[on the mat] -> {[doc<sub>1</sub>, ES], [doc<sub>2</sub>, ES], ...}  
[on the table] -> {[doc<sub>3</sub>, DE]}

- For each n-gram
  - generate all pairs where:
    - \* document list short ( $\leq 50$ )
    - \* source language different
- Result: [doc<sub>1</sub>, doc<sub>3</sub>], ...

# Scoring using Forward Index

43

- Forward index maps documents to n-grams
- For each document pair  $[d_1, d_2]$ 
  - collect scoring n-grams for both documents
  - build IDF-weighted vector
  - distance: cosine similarity

# Scoring Document Pairs

- Given

$$\text{ngrams}(d_1) = n_1, n_2, \dots, n_r$$

$$\text{ngrams}(d_2) = n'_1, n'_2, \dots, n'_{r'}$$

- Inverse document frequency

$$\text{idf}(n) = \log \frac{|D|}{\text{df}(n)}$$

where:  $|D|$  = number of documents

$\text{df}(n)$  = number of documents with  $n$

- Scoring of IDF-weighted vectors  $v$

$$v_{1,x} = \text{idf}(n_x) \text{ if } n_x \in \text{ngrams}(d_1), 0 \text{ otherwise}$$

$$v_{2,x} = \text{idf}(n_x) \text{ if } n_x \in \text{ngrams}(d_2), 0 \text{ otherwise}$$

$$\text{score}(d_1, d_2) = \frac{v_1 \cdot v_2}{||v_1||||v_2|||}$$

# sentence alignment

# Sentence Alignment

- Much early work in 1990s, e.g., Gale and Church (1991)
  - find sequence of 1-1, 1-2, 0-1, etc., sentence alignment groups
  - good element in sequence = similar number of words
  - dynamic programming search for best sequence
- Featurized alignments
  - with dictionary (Hunalign)
  - with induced dictionary (Gargantua)
  - consider tags such as <P>
- Sensitive to noise — often large parts of page not translated

# Filtering Bad Data

- Mismatched sentence pairs from errors in pipeline
- Non-literal translation
  - e.g. news stories are notoriously non-literal
- Bad translations
- Machine translation
  - much of the parallel text on the Internet generated by Google Translate
  - detection hard — looks like very clean parallel data
  - maybe too clean (little reordering, very literal)
  - watermarking machine translation (Venugopal et al., 2011)
- How clean should it be?
  - trade-off between precision and recall unclear

# Open Challenges

- Currently serious attempt at broad crawling for parallel data at JHU
- Major challenges
  - crawling (just using standard tool)■
  - document alignment (major research topic)  
→ shared task at WMT 2016 machine translation conference■
  - sentence alignment (just using standard tool)■
  - detection of machine translated text (some old work)■
  - filtering out bad sentence pairs (major research topic)  
→ shared task at WMT 2018 machine translation conference■
- JHU efforts: continuously processing tera bytes of data
